

Mobile and Computer Store System

Constantine 2 University - Abdelhamid Mehri

Module: PWEB

Project Title: Mobile and Computer Store System

We aim to develop a website for a retail store that sells mobile phones, laptops, tablets, and accessories. Students must suggest a store name, logo, and a modern tech-themed design. A maximum of three students per project is allowed, all from the same group. The first project evaluation will take place during the week of April 17th.

The project includes two main websites: one for customers to browse and place orders, and another for administrators to manage inventory and monitor orders.

Part 1: Frontend Only (HTML, CSS, JavaScript)

Build the UI for the tech store with dynamic, user-friendly elements. The frontend consists of the following client pages:

1. Home Page (index.html)

- Displays a catalog of mobile devices and computers in a grid format (image, model, price).
- Navigation bar with links to other sections.
- Filter section for brand, price range, device type (mobile/laptop), etc.
- JavaScript for sorting and filtering products.

2. Product Details Page (product.html)

- Displays detailed information about a selected product (images, specs, price, availability).
- Users can select options like storage and color, then click "Add to Cart."
- JavaScript enables image switching and dynamic selection updates.

3. Shopping Cart Page (cart.html)

- Shows list of added products with image, model, price, quantity.
- Users can modify quantities or remove items.
- JavaScript dynamically updates total cost.

4. Checkout Page (checkout.html)

- Simple form for collecting delivery and payment details.
- JavaScript handles form validation.

Part 2: Admin System

5. Admin Dashboard

- Login system for administrators.
- Dashboard shows summary stats (product count, current orders, user activity).
- Quick search and filter tools for managing devices.

6. Product Management

- Admins can add/edit/remove products.
- Each product includes fields like name, brand, price, category, specs, quantity, and images.
- Ability to manage product categories (smartphones, laptops, accessories, etc.).

7. Order Management

- Admin view of all customer orders.
- Update order statuses (e.g., In Progress, Delivered).
- Option to export order history for tracking.

8. User Management

- Display registered users.
- Assign roles (admin, client).
- Block or delete users as needed.

Part 3: Client Interface Enhancements

9. Responsive Design

- Clean, responsive design using CSS Flexbox/Grid.
- Easy navigation and clear product categorization.
- High-quality product visuals.

10. User Authentication

- Sign-up and login functionality.
- Secure authentication and password handling.
- User profile page for managing account information.

11. Shopping Cart Features

- Add items with quantity selection.

- Update or remove products from the cart.
- Persistent session storage for cart state.

12. Order System

- Checkout form with delivery details.
- Final review before confirming an order.
- Choose between cash on delivery or future payment integrations.
- Users can view their order history.

Part 4: Advanced Features & Deployment (optional)

Key Add-ons:

13. Backend system with a database (e.g., MySQL, MongoDB) to store users, orders, and inventory.
14. RESTful API for interacting with product data and orders.
15. Detailed user profile with order tracking and preferences.
16. Deployment on a free hosting platform (e.g., GitHub Pages, Netlify, Vercel).
